ABSTRACT
Benzimidazole pharmacophore possess broad class of curative properties like anthelmintic, antiulcer, antihypertensive, anticancer, etc. In view of this reason benzimidazole derivatives synthesis gained vital significance in recent years. In this investigation, a series of novel substituted benzimidazole derivatives having furan appendage at 2nd position and alkyl/aryl appendage at 1st position were synthesized by using appropriate procedures. All the compounds synthesized were characterized by physically (Rf values, Melting point, Molecular weight, Molecular formula) and were characterized by spectral data (1H-NMR, 13C-NMR, IR and Mass spectra). All the synthesized compounds were screened for molecular docking studies on human gamma-tubulin protein to find out the binding interaction at the target active site. Molecular docking studies at human gamma-tubulin protein states that the compound 4b showed good binding affinity (-8.98 kcal/mol) in comparison to the reference compound Albendazole (-8.47 kcal/mol).

INTRODUCTION
In the current drug discovery research, heterocyclic ring containing drug molecules gained much more importance. Heterocyclic compounds take over various fields such as organic chemistry, medicinal chemistry, biochemistry, agricultural sciences. Heterocyclic compounds chemistry played a fundamental role in the metabolism of most of all living cells[1]. Among different classes of heterocyclic compounds, benzimidazole is the key scaffold which can be found in many active pharmaceutical ingredients. The benzimidazoles contain a phenyl ring fused to an imidazole ring, as indicated in the structure for benzimidazole. Currently used antiulcer drugs- Omeprazole, Lansoprazole, Pantoprazole, Rabeprazole; anthelmintic drugs- Albendazole, Mebendazole, Thiabendazole possessing benzimidazole moiety were mentioned (Fig. 1).

Fig. 1: Commonly used benzimidazole pharmacophore containing drugs
Benzimidazole nucleus containing compounds or derivatives possess broad range of therapeutic activities like anthelmintic, antiviral, antiulcer, antihypertensive, anticancer, etc. In recent years benzimidazole derivatives gained much more importance in organic synthesis[2,3]. Diverse synthetic approaches were reported in the literature for benzimidazole ring synthesis. o-phenylenediamine was condensed with various aldehydes using solid-supported catalyst[4], transition metal catalysts like Sc(OTf)3[5], Yb(OTf)3[6], FeCl3·6H2O[7], In(OTf)3[8]. Cobalt complexes[9] and also in the presence of different oxidizing agents like air[10], Pb(OAc)2[11], Sulphamic acid[12], MnO2[13], Oxone[14], Iodine[15], H2O2–HCl[16], DDQ[17] etc. Other approach states carboxylic acids condensed with o-phenylenediamine in the presence of acid catalysts[18], Pharmaceutical, veterinary and agrochemical products developed with benzimidazole moiety includes Albendazole, mebendazole, thiabendazole, astemizole, lansoprazole, omeprazole, pantoprazole, etc[9]. Phillip’s method[20], involves in the condensation of o-phenylenediamine with carboxylic acids or its derivatives, including heating the reagents together in the presence of concentrated HCL (Scheme 1), is the most common synthetic method for preparation of a wide range of benzimidazoles.

In the present work a series of novel substituted benzimidazole derivatives having furan appendage at 2nd position and alkyl/aryl appendage at 1st position were synthesized by using appropriate procedures. All the synthesized compounds were characterised and tested for molecular docking studies.

MATERIALS AND METHODS

All the chemicals and reagents for the synthesis of N-substituted-2-(furan-3-yl)-1H-benzimidazole derivatives were procured from commercial suppliers of Merck grade. Completion of the reaction was monitored by thin layer chromatography with the help of E.Merck grade precoated silica gel 60-GF-254 TLC plates. Melting points were determined by using electrical melting point apparatus and those were uncorrected. By using KBr pressed pellet technique, IR spectra of the compounds were recorded in Bruker FT-IR analyzer spectrophotometer. Chemical shifts in ppm of 1H-NMR spectra and 13C-NMR were recorded on Bruker-AMX-400MHz spectrophotometer using deuterated dimethyl sulfoxide (DMSO) solvent and tetramethylsilane (TMS) as internal standard. Mass spectra of the compounds were recorded on an Agilent LC-MSD-1200 mass spectrometer. All the novel synthesized compounds were evaluated for molecular docking studies on β-tubulin protein to find out the binding interaction at the target site.

EXPERIMENTAL
Lemon Juice Preparation

Lemon botanically *Citrus limonium*, *Citrus aurantium* and *Citrus indica* are the species of citrus family. Presence of citric acid and ascorbic acids in lemon juice acts as acid catalyst in organic reactions. Fresh lemons were purchased, obtained the juice by making them into pieces and with the help of juicer. Juice was further filtered through filter paper and clear solution of juice was used as reaction catalyst. The pH of the extracted lemon juice was found to be 2.4.

**Step-I: Procedure for Synthesis of 2-(furan-3-yl)-1H-benzimidazole (3)**

To a mixture of o-phenylenediamine (0.02 mol) and furfural (0.02 mol) add 6-8ml of 1:1 V/V lemon juice: water mixture. The reaction mixture was refluxed for 3-4 hrs at 80°C. The completion of the reaction was confirmed by TLC (using Silica Gel - G stationary phase and ethylacetate:hexane, 1:2 V/V as mobile phase). The reaction mixture was quenched with cold water and stirred continuously until free flowing solid was obtained. The resulting solid was filtered, air dried and purified by recrystallization from 95% ethanol to get pure product.

**Step-II: Procedure for synthesis of N-substituted-2-(furan-3-yl)-1H-benzimidazole (4a-4e)**

To a mixture of 2-(furan-3-yl)-1H-benzimidazole (3) (0.02 mol) and alkyl/aryl halide (0.02 mol) in 10ml of THF, little quantity of sodium hydride (2 g) was added. The resulting mixture was stirred for 8-12 hrs at 40-50°C. The completion of the reaction was confirmed by TLC (using Silica Gel - G stationary phase and ethylacetate: hexane, 1:2 V/V as mobile phase). Excess solvent was removed by distillation. The crude product was washed with cold water, extracted with ethyl acetate and finally purified by recrystallization from 95% ethanol to get pure product.

**Spectral Data**

**N-benzyl-2-(furan-3-yl)-1H-benzimidazole (4a):**

IR [KBr, cm⁻¹]: 3064.24 (=CH stretch), 2963.18 (=CH stretch), 1628.46 (C=O stretch), 1567.18 (C=C stretch), 1329.09 (1H, d, Furan C-H), 7.816 (1H, s, Furan C2-H), 7.408 (2H, q, Phenyl). 1H-NMR (400 MHz, DMSO-D6) δ: 7.914 (1H, s, Furan C2-H), 6.845-7.017 (1H, d, Furan C2-H), 7.215-7.321 (1H, d, Furan C2-H), 7.397-7.505 (5H, m, Phenyl), 7.611-7.698 (2H, dd, benzimidazole C5-H & C6-H), 7.892-7.917 (2H, dd, benzimidazole C5-H & C6-H), 5.523 (2H, s, -CH2-Phenyl). 13C-NMR (100 MHz, DMSO-D6) δ: 122.88, 119.34, 117.36, 107.37, 53.48. ESI-MS: m/z (M⁺) 274.

**N-benzoyl-2-(furan-3-yl)-1H-benzimidazole (4b):**

IR [KBr, cm⁻¹]: 3019.88 (=CH stretch), 1709.44 (C=O stretch), 1633.94 (C=N stretch), 1555.72 (C=C stretch), 1309.65 (C=N stretch), 1086.12 (C-O stretch). 1H-NMR (400 MHz, DMSO-D6) δ: 8.682-7.200 (1H, d, Furan C2-H), 7.219-7.478 (5H, m, Phenyl), 7.506-7.526 (2H, dd, benzimidazole C5-H & C6-H), 7.742-7.747 (1H, d, Furan C2-H), 7.880-7.899 (2H, dd, benzimidazole C5-H & C6-H), 8.069 (1H, s, Furan C2-H). 13C-NMR (100 MHz, DMSO-D6) δ: 165.73, 145.35, 140.21, 138.71, 136.54, 134.11, 133.08, 131.92, 130.31, 126.64, 126.45, 123.10, 116.76, 113.28, 108.59. ESI-MS: m/z (M⁺) 288.

**N-(o-hydroxyphenyl)-2-(furan-3-yl)-1H-benzimidazole (4c):**

IR [KBr, cm⁻¹]: 3423.29 (OH stretch), 3070.51 (=CH stretch), 1608.26 (C=N stretch), 1528.80 (C=C stretch), 1318.47 (C=N stretch), 1079.09 (C-O stretch). 1H-NMR (400 MHz, DMSO-D6) δ: 7.860-7.127 (1H, d, Furan C2-H), 7.239-7.280 (4H, m, Phenyl), 7.511-7.539 (2H, dd, benzimidazole C5-H & C6-H), 7.746-7.767 (1H, d, Furan C2-H), 7.886-7.900 (2H, dd, benzimidazole C5-H & C6-H), 8.095 (1H, s, Furan C2-H), 5.323 (1H, s, OH). 13C-NMR (100 MHz, DMSO-D6) δ: 149.26, 146.32, 143.18, 141.08, 138.64, 135.19, 129.71, 127.84, 126.33, 124.55, 122.07, 120.38, 118.47, 115.81, 112.42, 107.66. ESI-MS: m/z (M⁺) 276.

**N-acetyl-2-(furan-3-yl)-1H-benzimidazole (4d):**

IR [KBr, cm⁻¹]: 3044.35 (=CH stretch), 2966.25 (=CH stretch), 1715.08 (C=O stretch), 1624.22 (C=N stretch), 1549.64 (C=C stretch), 1333.60 (C-N stretch), 1077.15 (C-O stretch). 1H-NMR (400 MHz, DMSO-D6) δ: 7.708 (1H, s, Furan C2-H), 6.964-7.108 (1H, d, Furan C2-H), 7.402-7.499 (1H, d, Furan C2-H), 7.227-7.318 (2H, dd, benzimidazole C5-H & C6-H), 7.542-7.609 (2H, dd, benzimidazole C5-H & C6-H), 2.548 (3H, s, -COCH3). 13C-NMR (100 MHz, DMSO-D6) δ: 167.29, 145.19, 142.37, 138.26, 135.97, 133.47, 128.47, 124.08, 116.37, 113.48, 108.72, 23.67. ESI-MS: m/z (M⁺) 226.

**N-ethyl-2-(furan-3-yl)-1H-benzimidazole (4e):**

IR [KBr, cm⁻¹]: 3056.97 (=CH stretch), 2989.27 (=CH stretch), 1633.83 (C=N stretch), 1569.55 (C=C stretch), 1348.73 (C=N stretch), 1081.86 (C-O stretch). 1H-NMR (400 MHz, DMSO-D6) δ: 7.816 (1H, s, Furan C2-H), 6.817-6.907 (1H, d, Furan C2-H), 7.195-7.207 (1H, d, Furan C2-H), 7.310-7.399 (2H, dd, benzimidazole C5-H & C6-H), 7.566-7.611 (2H, dd, benzimidazole C5-H & C6-H), 4.156-4.408 (2H, q, -CH2CH3), 1.391-1.529 (3H, t, -CH2CH3). 13C-NMR (100 MHz, DMSO-D6) δ: 156.09, 145.31, 141.20,
molecular docking studies

Molecular docking studies on human gamma tubulin protein[23]. The ligand molecules were designed, and the structures were analyzed by using ChemDraw Ultra 12.0. Three-dimensional (3D) structure coordinates were prepared using Chem3D ultra 12.0. Nonpolar hydrogen atoms were merged, and the rotatable bonds were set by using Auto-Dock 4.2 Tools. The crystal structure of human gamma tubulin (PDB ID: 1Z5V) was selected from the PDB (www.rcsb.org/pdb) and was edited by removing the heteroatoms, adding C terminal oxygen. Polar hydrogens and Gasteiger charges were added after merging non-polar hydrogens. The grid map was centered at the active pocket of the protein by AutoGrid4. It is the grid map, which was centered at the active pocket of the protein. Automated docking was used to determine the orientation of inhibitors bound in the active site. A Lamarckian genetic algorithm method, implemented in the program AutoDock 4.2, was employed to identify appropriate binding modes and conformations of the ligand. The Lamarckian genetic algorithm methods were applied for minimization, using default parameters. Binding energy, number of H-bonds, H-bond length and amino acid residues interacted were recorded in each ligand conformations.

RESULTS AND DISCUSSION

N-substituted-2-(furan-3-yl)-1H-benzimidazole derivatives were synthesized using the appropriate synthetic procedure (Scheme 2) i.e. reaction of o-phenylenediamine (1) and furfural (2) in presence of lemon juice and water gives 2-(furan-3-yl)-1H-benzimidazole (3). Further the title compounds 1-substituted-2-substituted benzimidazole derivatives (4a-4e) were prepared by the reaction of 2-(furan-3-yl)-1H-benzimidazole (3) with different alkyl/aryl halides in presence of sodium hydride using THF as solvent. The progress of the reaction was monitored by TLC. Finally, the reaction mixture was poured onto the crushed ice and then recrystallized from ethanol. Melting points were determined in open capillaries and were uncorrected. IR spectra of the compounds were recorded in KBr discs on Bruker FT-IR analyzer spectrophotometer. 1H-NMR spectra were recorded on Bruker-400MHz spectrophotometer and 13C-NMR spectra were recorded on Bruker-AMX-400MHz spectrophotometer. Mass spectra of the compounds were recorded on an Agilent LC-MSD-1200 mass spectrometer. Physical characterization data of all the synthesized compounds were given in Table I.

The molecular docking of ligand molecules with human gamma-tubulin revealed that most of the molecules exhibited the bonding with one or the other amino acids in the active pockets. Theoretically all the ligand molecules showed encouraging binding energy. Among the five molecules, docking of human gamma-tubulin revealed that their binding energy were -6.89, -8.98, -8.66, -8.35 and -7.88 kcal/mol respectively. Molecules 4b and 4c showed significant binding affinity towards the active pocket with good binding energy, ligand efficiency and hydrogen bonding, those can be considered as good inhibitor of human gamma-tubulin. The binding energy values revealed that the compounds 4b and 4c showed good binding affinity towards the human gamma-tubulin and the computed values were depicted in the Table II. The interaction of Albendazole at the active site of the
human gamma-tubulin has showed binding energy of -8.47 kcal/mol and the amino acids interacted were Thr131, Gly132, Gly129, Val160, Ser126 and Cys12. The 3D structure of human gamma-tubulin, docking complex of human gamma-tubulin protein-1Z5V against Albendazole, compound 4b and compound 4c was shown in the Fig. 2. The compound 4b shown promising binding affinity i.e. -8.98 kcal/mol and the amino acids interacted were Phe208, Cys12, Ser126, Ala128, Val157, Pro159, Asn190.

CONCLUSION
A facile method under mild conditions has been developed for the synthesis of the title compounds. In this investigation various novel benzimidazole derivatives (4a-4e) possessing furan appendage at 2nd position and alkyl/aryl appendage at 1st position were developed. Characterization of the compounds was done by physically and spectrally. Among the synthesized compounds N-((hydroxyphenyl)-2-(furan-3-yl)-1H-benzimidazole (4c) gives high percentage yield. Molecular docking studies at human gamma-tubulin protein states that the compound 4b and 4c showed good binding affinity (-8.98 & -8.66 kcal/mol) in comparison to the reference compound Albendazole (-8.47 kcal/mol).
